

# Modern JS: Babel Configuration

Open [forkify\\_mvc.html](https://github.com/jonasschmedtmann/forkify_mvc.html) for the markup/code | Images are taken from: [JS Course by Jonas Schmedtmann](#)

We will build our project using the **MVC** architecture which stands for **Model**, **View** & **Controller** architecture. We logically build our app by separating concerns for the **Model (data)** and **View (front-end related)** using our **Controller (where everything inter-mingles)** as shown in the image above. Now to logically separate code Model, View & Controller, we will use the ES6 Modules to our advantage and make our codebase easy to read and access.
